25 In attempting to solve the system of equations \( y = 3x - 2 \) and \( 6x - 2y = 4 \), John graphed the two equations on his graphing calculator. Because he saw only one line, John wrote that the answer to the system is the empty set. Is he correct? Explain your answer.

No, he is not correct because they are the same line so all points on \( y = 3x - 2 \) are on the line \( 6x - 2y = 4 \).

Score 2: The student gave a complete and correct response.
In attempting to solve the system of equations $y = 3x - 2$ and $6x - 2y = 4$, John graphed the two equations on his graphing calculator. Because he saw only one line, John wrote that the answer to the system is the empty set. Is he correct? Explain your answer.

John is incorrect, because the equations are the same; the solution set is any point on the line.

Score 2: The student gave a complete and correct response.
Question 25

25 In attempting to solve the system of equations $y = 3x - 2$ and $6x - 2y = 4$, John graphed the two equations on his graphing calculator. Because he saw only one line, John wrote that the answer to the system is the empty set. Is he correct? Explain your answer.

Score 1: The student wrote an incomplete explanation.
In attempting to solve the system of equations \( y = 3x - 2 \) and \( 6x - 2y = 4 \), John graphed the two equations on his graphing calculator. Because he saw only one line, John wrote that the answer to the system is the empty set. Is he correct? Explain your answer.

The two lines are the same so there are an infinite number of solutions.

Score 1: The student wrote a correct explanation, but did not indicate he is incorrect.
25 In attempting to solve the system of equations \( y = 3x - 2 \) and \( 6x - 2y = 4 \), John graphed the two equations on his graphing calculator. Because he saw only one line, John wrote that the answer to the system is the empty set. Is he correct? Explain your answer.

\[
\begin{align*}
6x - 2y &= 4 \\
-2y &= 4 - 6x \\
y &= 3x - 2
\end{align*}
\]

He is correct. Because this two equations is have same answer. Both is \( y = 3x - 2 \). That is why is only have one line.

**Score 0:** The student wrote an incomplete explanation, and stated “he is correct” instead of “he is incorrect.”
25 In attempting to solve the system of equations \( y = 3x - 2 \) and \( 6x - 2y = 4 \), John graphed the two equations on his graphing calculator. Because he saw only one line, John wrote that the answer to the system is the empty set. Is he correct? Explain your answer.

He is wrong

**Score 0:** The student did not write an explanation.
Question 26

26 A typical marathon is 26.2 miles. Allan averages 12 kilometers per hour when running in marathons.

Determine how long it would take Allan to complete a marathon, to the nearest tenth of an hour. Justify your answer.

\[
\frac{1 \text{ mi}}{1.609 \text{ km}} = \frac{26.2 \text{ mi}}{x \text{ km}}
\]

\[
x = \frac{42.1558 \text{ km/marathon}}{}
\]

\[
\frac{12 \text{ km}}{1 \text{ hr}} = \frac{42.1558}{x \text{ hrs.}}
\]

\[
12x = 42.1558
\]

\[
x = 3.512983
\]

\[
x \approx 3.5 \text{ hrs.}
\]

Score 2: The student gave a complete and correct response.
A typical marathon is 26.2 miles. Allan averages 12 kilometers per hour when running in marathons.

Determine how long it would take Allan to complete a marathon, to the nearest tenth of an hour. Justify your answer.

\[
1 \text{ km} = 0.62 \text{ mile} \\
62 \cdot 12 = 744 \\
\frac{26.2}{7.44} \approx 3.5
\]

I got 3.5 hrs because first I found out how many miles Allan can run in an hour. Then I did the total miles over the # of miles he can run in 1 hr and I got roughly 3.5.

Score 2: The student gave a complete and correct response.
26 A typical marathon is 26.2 miles. Allan averages 12 kilometers per hour when running in marathons.

Determine how long it would take Allan to complete a marathon, to the nearest tenth of an hour. Justify your answer.

\[
\text{1 mile} = 1.609 \text{ kilometers} \\
1.609 \text{ km - 26.2} = 16.28 \\
\frac{16.28}{12} = 1.35 = 1.4 \text{ hours}
\]

Allan can complete the marathon in 1.4 hours.

Score 1: The student made an error when converting 26.2 miles to km.
26 A typical marathon is 26.2 miles. Allan averages 12 kilometers per hour when running in marathons.

Determine how long it would take Allan to complete a marathon, to the nearest tenth of an hour. Justify your answer.

\[
26.2 \text{ miles} \times 0.62 = 16.244 \text{ km}
\]

\[
16.244 \text{ km} \times \frac{1 \text{ hr}}{12 \text{ km}} = 1.3536 \text{ hrs}
\]

\[
\boxed{1.3 \text{ hrs}}
\]

29 Graph the inequality \( y > 2x - 5 \) on the set of axes below. State the coordinates of a point in its solution.

**Score 0:** The student graphed the inequality incorrectly and the point is not in the solution set.
30 Sandy programmed a website's checkout process with an equation to calculate the amount customers will be charged when they download songs.

The website offers a discount. If one song is bought at the full price of $1.29, then each additional song is $0.99.

State an equation that represents the cost, $C$, when $s$ songs are downloaded.

\[ C = 1.29 + 0.99(s-1) \]

Sandy figured she would be charged $52.77 for 52 songs. Is this the correct amount? Justify your answer.

\[ C = 1.29 + 0.99(52-1) \]
\[ C = 1.29 + 50.49 \]
\[ C = 51.78 \]

No

**Score 2:** The student gave a complete and correct response.
30 Sandy programmed a website’s checkout process with an equation to calculate the amount customers will be charged when they download songs.

The website offers a discount. If one song is bought at the full price of $1.29, then each additional song is $0.99.

State an equation that represents the cost, \( C \), when \( s \) songs are downloaded.

\[
y = 1.29 + 0.99(x-1)
\]

Sandy figured she would be charged $52.77 for 52 songs. Is this the correct amount? Justify your answer.

\[
y = 1.29 + 0.99(52-1)
\]

\[
y = 1.29 + 50.49
\]

\[
y = 51.78 \quad \text{No}
\]

Score 2: The student redefined the variables and completed the response correctly.
Sandy programmed a website’s checkout process with an equation to calculate the amount customers will be charged when they download songs.

The website offers a discount. If one song is bought at the full price of $1.29, then each additional song is $0.99.

State an equation that represents the cost, $C$, when $s$ songs are downloaded.

\[ C = s - 0.01(s - 30) \]

Sandy figured she would be charged $52.77 for 52 songs. Is this the correct amount? Justify your answer.

\[ C = 52 - 0.01(52 - 30) \]
\[ C = 52 - 1.22 \]
\[ C = 51.78 \]

No, she would pay $51.78 for 52 songs.

**Score 2:** The student used an alternate appropriate equation.
30 Sandy programmed a website's checkout process with an equation to calculate the amount customers will be charged when they download songs.

The website offers a discount. If one song is bought at the full price of $1.29, then each additional song is $0.99.

State an equation that represents the cost, \( C \), when \( s \) songs are downloaded.

\[ C = 1.29 + (s - 1) \times 0.99 \]

Sandy figured she would be charged $52.77 for 52 songs. Is this the correct amount? Justify your answer.

This is not correct because the first song is $1.29, then the rest are $0.99 so $1.29 + 51 \times 0.99 = 51.79$ not $52.77$.

Score 1: The student only wrote a correct justification indicating that Sandy was incorrect.
30 Sandy programmed a website's checkout process with an equation to calculate the amount customers will be charged when they download songs.

The website offers a discount. If one song is bought at the full price of $1.29, then each additional song is $0.99.

State an equation that represents the cost, \( C \), when \( s \) songs are downloaded.

\[
C(s) = 1.29 + 0.99(s-1)
\]

Sandy figured she would be charged $52.77 for 52 songs. Is this the correct amount? Justify your answer.

\[
C(52) = 1.29 + 0.99(52-1) \\
= 1.29 + 0.99(51) \\
= 1.29 + 50.49 \\
= 51.78
\]

**Score 1:** The student wrote an appropriate function but did not state whether or not the amount is correct.
30 Sandy programmed a website’s checkout process with an equation to calculate the amount customers will be charged when they download songs.

The website offers a discount. If one song is bought at the full price of $1.29, then each additional song is $0.99.

State an equation that represents the cost, $C$, when $s$ songs are downloaded.

\[
C(s) = \begin{cases} 
1.29 & \text{if } s = 1 \\
0.99s + 0.30 & \text{if } s > 1 
\end{cases}
\]

Sandy figured she would be charged $52.77 for 52 songs. Is this the correct amount? Justify your answer.

\[
0.99 \times 52 + 0.30 = 51.78
\]

Score 1: The student wrote a correct piecewise function but did not state whether or not the amount is correct.
30 Sandy programmed a website's checkout process with an equation to calculate the amount customers will be charged when they download songs.

The website offers a discount. If one song is bought at the full price of $1.29, then each additional song is $0.99.

32 Nora says that the graph of a circle is a function because she can trace the whole graph without picking up her pencil.

Mia says that a circle graph is *not* a function because multiple values of $x$ map to the same $y$-value.

Determine if either one is correct, and justify your answer completely.

Both are incorrect, though the circle is *not* a function because it fails the vertical line test. Just because a line is continuous doesn’t mean it is a function. Multiple $x$-values can match up to one $y$-value, but not vice-versa.

**Score 2:** The student gave a complete and correct response.
32 Nora says that the graph of a circle is a function because she can trace the whole graph without picking up her pencil.

Mia says that a circle graph is not a function because multiple values of $x$ map to the same $y$-value.

Determine if either one is correct, and justify your answer completely.

Nora is incorrect because even though she can draw a circle without picking up her pencil it fails the vertical line test.

Mia is correct that it isn’t a function but the $x$ and $y$’s are switched in her explanation.

Score 2: The student gave a complete and correct response.
32 Nora says that the graph of a circle is a function because she can trace the whole graph without picking up her pencil.

Mia says that a circle graph is not a function because multiple values of $x$ map to the same $y$-value.

Determine if either one is correct, and justify your answer completely.

Score 1: The student did not justify why Nora was not correct.
Question 32

32 Nora says that the graph of a circle is a function because she can trace the whole graph without picking up her pencil.

Mia says that a circle graph is *not* a function because multiple values of \( x \) map to the same \( y \)-value.

Determine if either one is correct, and justify your answer completely.

*Neither* is correct. It is not a function because it fails the vertical line test.

Score 1: The student wrote an incomplete justification.
32 Nora says that the graph of a circle is a function because she can trace the whole graph without picking up her pencil.

Mia says that a circle graph is not a function because multiple values of $x$ map to the same $y$-value.

Determine if either one is correct, and justify your answer completely.

Score 1: The student only justified Nora's error in reasoning.
32 Nora says that the graph of a circle is a function because she can trace the whole graph without picking up her pencil.

Mia says that a circle graph is not a function because multiple values of $x$ map to the same $y$-value.

Determine if either one is correct, and justify your answer completely.

If the circle was half on the $y$ or $x$ axis, it would not be a function, both girls are partially correct because a circle graph is a function when they point in the $x$ axis, so they don't reflect back toward each other, and if it is on $y$ axis, the points will reflect on each other making it not a function. A function can only go to a point one time.

Score 0: The student gave an incorrect response.
33 Graph $f(x) = |x|$ and $g(x) = -x^2 + 6$ on the grid below.
Does $f(-2) = g(-2)$? Use your graph to explain why or why not.

The graph of $f(x)$ intersects the graph of $g(x)$ at $x = -2$, so $f(-2) = g(-2)$.

Score 4: The student gave a complete and correct response.
33 Graph \( f(x) = |x| \) and \( g(x) = -x^2 + 6 \) on the grid below.
Does \( f(-2) = g(-2) \)? Use your graph to explain why or why not.

\[
\begin{align*}
  f(-2) &= |-2| = 2 \\
g(-2) &= -(-2)^2 + 6 = 2
\end{align*}
\]

Yes because when you plug in \(-2\) for \( x \), they both come out the same answer.

Score 3: The student justified \( f(-2) = g(-2) \) algebraically.
33 Graph \( f(x) = |x| \) and \( g(x) = -x^2 + 6 \) on the grid below.

Does \( f(-2) = g(-2) \)? Use your graph to explain why or why not.

Yes because the two numbers intersect.

Score 3: Both graphs are drawn correctly.
33 Graph $f(x) = |x|$ and $g(x) = -x^2 + 6$ on the grid below.
Does $f(-2) = g(-2)$? Use your graph to explain why or why not.

Score 2: The student graphed the parabola correctly. The arrows were missing on the graph of the absolute value.
Question 33

33 Graph \( f(x) = |x| \) and \( g(x) = -x^2 + 6 \) on the grid below.
Does \( f(-2) = g(-2) \)? Use your graph to explain why or why not.

Score 1: The student did not put arrows on the graph of the parabola.
33 Graph \( f(x) = |x| \) and \( g(x) = -x^2 + 6 \) on the grid below. Does \( f(-2) = g(-2) \)? Use your graph to explain why or why not.

Score 0: The student did not put arrows on the graph of the absolute value, did not explain their “no” response, and graphed \( g(x) \) incorrectly.
Two friends went to a restaurant and ordered one plain pizza and two sodas. Their bill totaled $15.95. Later that day, five friends went to the same restaurant. They ordered three plain pizzas and each person had one soda. Their bill totaled $45.90.

Write and solve a system of equations to determine the price of one plain pizza. [Only an algebraic solution can receive full credit.]

Score 4: The student gave a complete and correct response.
Question 34

34 Two friends went to a restaurant and ordered one plain pizza and two sodas. Their bill totaled $15.95. Later that day, five friends went to the same restaurant. They ordered three plain pizzas and each person had one soda. Their bill totaled $45.90.

Write and solve a system of equations to determine the price of one plain pizza. [Only an algebraic solution can receive full credit.]

Score 4: The student gave a complete and correct response.
Two friends went to a restaurant and ordered one plain pizza and two sodas. Their bill totaled $15.95. Later that day, five friends went to the same restaurant. They ordered three plain pizzas and each person had one soda. Their bill totaled $45.90.

Write and solve a system of equations to determine the price of one plain pizza. [Only an algebraic solution can receive full credit.]

Let $x =$ price of pizza
Let $y =$ price of soda.

\[45.90 = 3x + 5y \quad (2)\]
\[15.90 = 3x + 2y \quad (5)\]

Subtract equation (5) from equation (2):
\[30.00 = 3y\]
\[y = 10\]

Substitute $y = 10$ into equation (5):
\[15.90 = 3x + 20\]
\[3x = 4.10\]
\[x = 1.37\]

\[\text{Score 3: } \text{The student made a transcription error when writing their second equation, but found an appropriate answer.}\]
Two friends went to a restaurant and ordered one plain pizza and two sodas. Their bill totaled $15.95. Later that day, five friends went to the same restaurant. They ordered three plain pizzas and each person had one soda. Their bill totaled $45.90.

Write and solve a system of equations to determine the price of one plain pizza. [Only an algebraic solution can receive full credit.]

Let \( x = \text{pizza} \) = $15.17

\( y = \text{soda} \) = $3.90

\(-\frac{1}{3}x + 2y = 15.95\)

\(-\frac{1}{3}(15.17) + 2(3.90) = 15.95\)

\(15.17 + 7.8 = 15.95\)

\(7.8 = 15.95 - 15.17\)

\(y = 3.90\)

Check:

\(-\frac{1}{3}x + 2y = 15.95\)

\(-\frac{1}{3}(15.17) + 2(3.90) = 15.95\)

\(15.17 + 7.8 = 15.95\)

\(7.8 = 15.95 - 15.17\)

\(y = 3.90\)

Score 3: The student wrote an incorrect second equation, but found an appropriate answer.
Question 34

Two friends went to a restaurant and ordered one plain pizza and two sodas. Their bill totaled $15.95. Later that day, five friends went to the same restaurant. They ordered three plain pizzas and each person had one soda. Their bill totaled $45.90.

Write and solve a system of equations to determine the price of one plain pizza. [Only an algebraic solution can receive full credit.]

\[
\begin{align*}
3x + 2a &= 15.95 \\
3x + 5a &= 45.90
\end{align*}
\]

Score 2: The student wrote a correct system of equations.
Two friends went to a restaurant and ordered one plain pizza and two sodas. Their bill totaled $15.95. Later that day, five friends went to the same restaurant. They ordered three plain pizzas and each person had one soda. Their bill totaled $45.90.

Write and solve a system of equations to determine the price of one plain pizza. [Only an algebraic solution can receive full credit.]

Let \( y \) = \# of sodas ordered

\[
\begin{align*}
3(x + 2y) &= 15.95 \\
\Rightarrow 3x + 6y &= 47.85 \\
3x + 3y &= 45.90 \\
\Rightarrow 6x + 9y &= 91.80
\end{align*}
\]

\[
\begin{align*}
x + y &= 94.75 \\
y &= 10.85
\end{align*}
\]

**Score 1:** The student only wrote one correct equation.
Two friends went to a restaurant and ordered one plain pizza and two sodas. Their bill totaled $15.95. Later that day, five friends went to the same restaurant. They ordered three plain pizzas and each person had one soda. Their bill totaled $45.90.

Write and solve a system of equations to determine the price of one plain pizza. [Only an algebraic solution can receive full credit.]

\[ p = \text{pizza} \]
\[ s = \text{soda} \]

\[ (p)(s^2) = 15.95 \]
\[ (p^3)(s^5) = 45.90 \]

Score 0: The student showed no correct work.
35 Tanya is making homemade greeting cards. The data table below represents the amount she spends in dollars, \( f(x) \), in terms of the number of cards she makes, \( x \).

<table>
<thead>
<tr>
<th>( x )</th>
<th>( f(x) )</th>
</tr>
</thead>
<tbody>

Write a linear function, \( f(x) \), that represents the data.

\[
f(x) = \frac{3}{4}x + 4.5
\]

Explain what the slope and \( y \)-intercept of \( f(x) \) mean in the given context.

The slope means that she spends $0.75 on each card, but the \( y \)-intercept says that she spent $4.50 initially to start making the cards.

Score 4: The student gave a complete and correct response.

State the coordinates of the vertex and explain its meaning in the context of the problem.

\[ \text{Vertex is the maximum point on the graph} \]

**Score 0:** The student did not show enough work to receive any credit.
37 Ian is borrowing $1000 from his parents to buy a notebook computer. He plans to pay them back at the rate of $60 per month. Ken is borrowing $600 from his parents to purchase a snowboard. He plans to pay his parents back at the rate of $20 per month.

Write an equation that can be used to determine after how many months the boys will owe the same amount.

\[
1000 - 60x = 600 - 20x
\]

Determine algebraically and state in how many months the two boys will owe the same amount. State the amount they will owe at this time.

\[
1000 - 60x = 600 - 20x \\
+60x \\
1000 = 600 + 40x \\
\rightarrow 400 = 40x \\
\rightarrow 10 = x
\]

Ian claims that he will have his loan paid off 6 months after he and Ken owe the same amount. Determine and state if Ian is correct. Explain your reasoning.

Ian is incorrect because 6 months after he and Ken owe the same amount, he still owes his parents $40. x is months. Ian and Ken will owe the same amount in 10 months. 1000 - 60(10) = y. y = total $ one. y = $40.

\[
1000 - 60(16) = y \\
1000 - 960 = y \\
40 = y
\]

Score 6: The student gave a complete and correct response.
Ian is borrowing $1000 from his parents to buy a notebook computer. He plans to pay them back at the rate of $60 per month. Ken is borrowing $600 from his parents to purchase a snowboard. He plans to pay his parents back at the rate of $20 per month.

Write an equation that can be used to determine after how many months the boys will owe the same amount.

\[
\frac{1000 - 60x}{400 - 20x} = \frac{400 - 40x}{100 - 40}
\]

Determine algebraically and state in how many months the two boys will owe the same amount. State the amount they will owe at this time.

\[
\frac{400 = 40x}{40 - 40} = \frac{600 = 20x}{600 = 20(30)} \quad \frac{600 = 20x}{600 = 20(1)} \quad \frac{x = 10}{\text{months}} \quad \text{$400$}
\]

Ian claims that he will have his loan paid off 6 months after he and Ken owe the same amount. Determine and state if Ian is correct. Explain your reasoning.

No. He will have $40 to pay after 6 months.

Score 6: The student gave a complete and correct response.
37 Ian is borrowing $1000 from his parents to buy a notebook computer. He plans to pay them back at the rate of $60 per month. Ken is borrowing $600 from his parents to purchase a snowboard. He plans to pay his parents back at the rate of $20 per month.

Write an equation that can be used to determine after how many months the boys will owe the same amount.

\[
\begin{align*}
\text{Ian:} & \quad 60x = 1000 \\
\text{Ken:} & \quad 20x = 600 \\
\hline
\text{Total:} & \quad 40x = 400
\end{align*}
\]

Determine algebraically and state in how many months the two boys will owe the same amount. State the amount they will owe at this time.

Ian claims that he will have his loan paid off 6 months after he and Ken owe the same amount. Determine and state if Ian is correct. Explain your reasoning.

At 10 months Ian only owes $400.

Score 5: The student did not show an algebraic solution to determine the number of months.
37 Ian is borrowing $1000 from his parents to buy a notebook computer. He plans to pay them back at the rate of $60 per month. Ken is borrowing $600 from his parents to purchase a snowboard. He plans to pay his parents back at the rate of $20 per month.

Write an equation that can be used to determine after how many months the boys will owe the same amount.

\[
\begin{align*}
\text{Ian} & : y = -60x + 1000 \\
\text{Ken} & : y = -20x + 600
\end{align*}
\]

\[-60x + 1000 = -20x + 600\]

Determine algebraically and state in how many months the two boys will owe the same amount. State the amount they will owe at this time.

\[
\begin{align*}
\text{Ian} & : y = -60(10) + 1000 \\
& = 400 \\
\text{Ken} & : y = -20(10) + 600 \\
& = 400
\end{align*}
\]

Ian claims that he will have his loan paid off 6 months after he and Ken owe the same amount. Determine and state if Ian is correct. Explain your reasoning.

\[\text{Ian is not correct!}\]

Score 4: The student did not write an explanation.
Question 37

37 Ian is borrowing $1000 from his parents to buy a notebook computer. He plans to pay them back at the rate of $60 per month. Ken is borrowing $600 from his parents to purchase a snowboard. He plans to pay his parents back at the rate of $20 per month.

Write an equation that can be used to determine after how many months the boys will owe the same amount.

\[1000 - 60x = 600 - 20x\]

Determine algebraically and state in how many months the two boys will owe the same amount. State the amount they will owe at this time.

Ian claims that he will have his loan paid off 6 months after he and Ken owe the same amount. Determine and state if Ian is correct. Explain your reasoning.

\[y = 1000 - 60x\]
\[y = 1000 - 60(6)\]
\[y = 1000 - 360\]
\[y = 640\]

\[NO, Ian is incorrect. He will still owe \$640\]

Score 4: The student used a method other than algebraic to determine the number of months and amount owed. The student also made an error in the explanation by not taking into consideration the ten months that had been paid.
Question 37

37 Ian is borrowing $1000 from his parents to buy a notebook computer. He plans to pay them back at the rate of $60 per month. Ken is borrowing $600 from his parents to purchase a snowboard. He plans to pay his parents back at the rate of $20 per month.

Write an equation that can be used to determine after how many months the boys will owe the same amount.

\[ I = 1000 - 60x \]
\[ K = 600 - 20x \]

Determine algebraically and state in how many months the two boys will owe the same amount. State the amount they will owe at this time.

Ian claims that he will have his loan paid off 6 months after he and Ken owe the same amount. Determine and state if Ian is correct. Explain your reasoning.

No, Ian is wrong. It will take Ian about 17 months to pay off his loan at a constant rate of $60 a month. The boys will both owe $400 at month 10 and Ken will be paid off in 30 months with a rate of $20.

Score 3: The student did not write a correct equation and used a nonalgebraic method to determine the number of months.
37 Ian is borrowing $1000 from his parents to buy a notebook computer. He plans to pay them back at the rate of $60 per month. Ken is borrowing $600 from his parents to purchase a snowboard. He plans to pay his parents back at the rate of $20 per month.

Write an equation that can be used to determine after how many months the boys will owe the same amount.

\[ y = -60x + 1000 \]  
\[ y = -20x + 600 \]

Determine algebraically and state in how many months the two boys will owe the same amount. State the amount they will owe at this time.

Ian claims that he will have his loan paid off 6 months after he and Ken owe the same amount. Determine and state if Ian is correct. Explain your reasoning.

Score 2: The student wrote an appropriate system of equations and used a nonalgebraic method to determine the number of months.
Question 37

37 Ian is borrowing $1000 from his parents to buy a notebook computer. He plans to pay them back at the rate of $60 per month. Ken is borrowing $600 from his parents to purchase a snowboard. He plans to pay his parents back at the rate of $20 per month.

Write an equation that can be used to determine after how many months the boys will owe the same amount.

\[
\begin{align*}
\text{Ian:} & \quad 60x = 1000 \\
\text{Ken:} & \quad 20x = 600
\end{align*}
\]

Determine algebraically and state in how many months the two boys will owe the same amount. State the amount they will owe at this time.

Ian claims that he will have his loan paid off 6 months after he and Ken owe the same amount. Determine and state if Ian is correct. Explain your reasoning.

Ian is not correct because he has to pay a total of $1000 and he has only paid $360.

Score 1: The student wrote individual equations for Ian and Ken.
37 Ian is borrowing $1000 from his parents to buy a notebook computer. He plans to pay them back at the rate of $60 per month. Ken is borrowing $600 from his parents to purchase a snowboard. He plans to pay his parents back at the rate of $20 per month.

Write an equation that can be used to determine after how many months the boys will owe the same amount.

\[ y = 1000x + 60 \quad \text{Ian} \]
\[ y = 600x + 20 \quad \text{Ken} \]

Determine algebraically and state in how many months the two boys will owe the same amount. State the amount they will owe at this time.

Now = $60, $20

Same amount = 10 months

Ian claims that he will have his loan paid off 6 months after he and Ken owe the same amount. Determine and state if Ian is correct. Explain your reasoning.

He is wrong because it took 10 months for them to owe the same amount.

Score 0: The student did not show enough correct work to receive any credit.
